Address Supporting Organization

“How It Works”

The Regional Internet Registry System

## Agenda

- Overview of the Regional Internet Registry System (RIR)
- Policy Development
- Internet Number Resources (IPv4, IPv6 and ASNs)
- Routing
- Noteworthy Developments
- RIR Services and Tools

**ICANN | ASO**

Address Supporting Organization

# The Regional Internet Registry (RIR) System

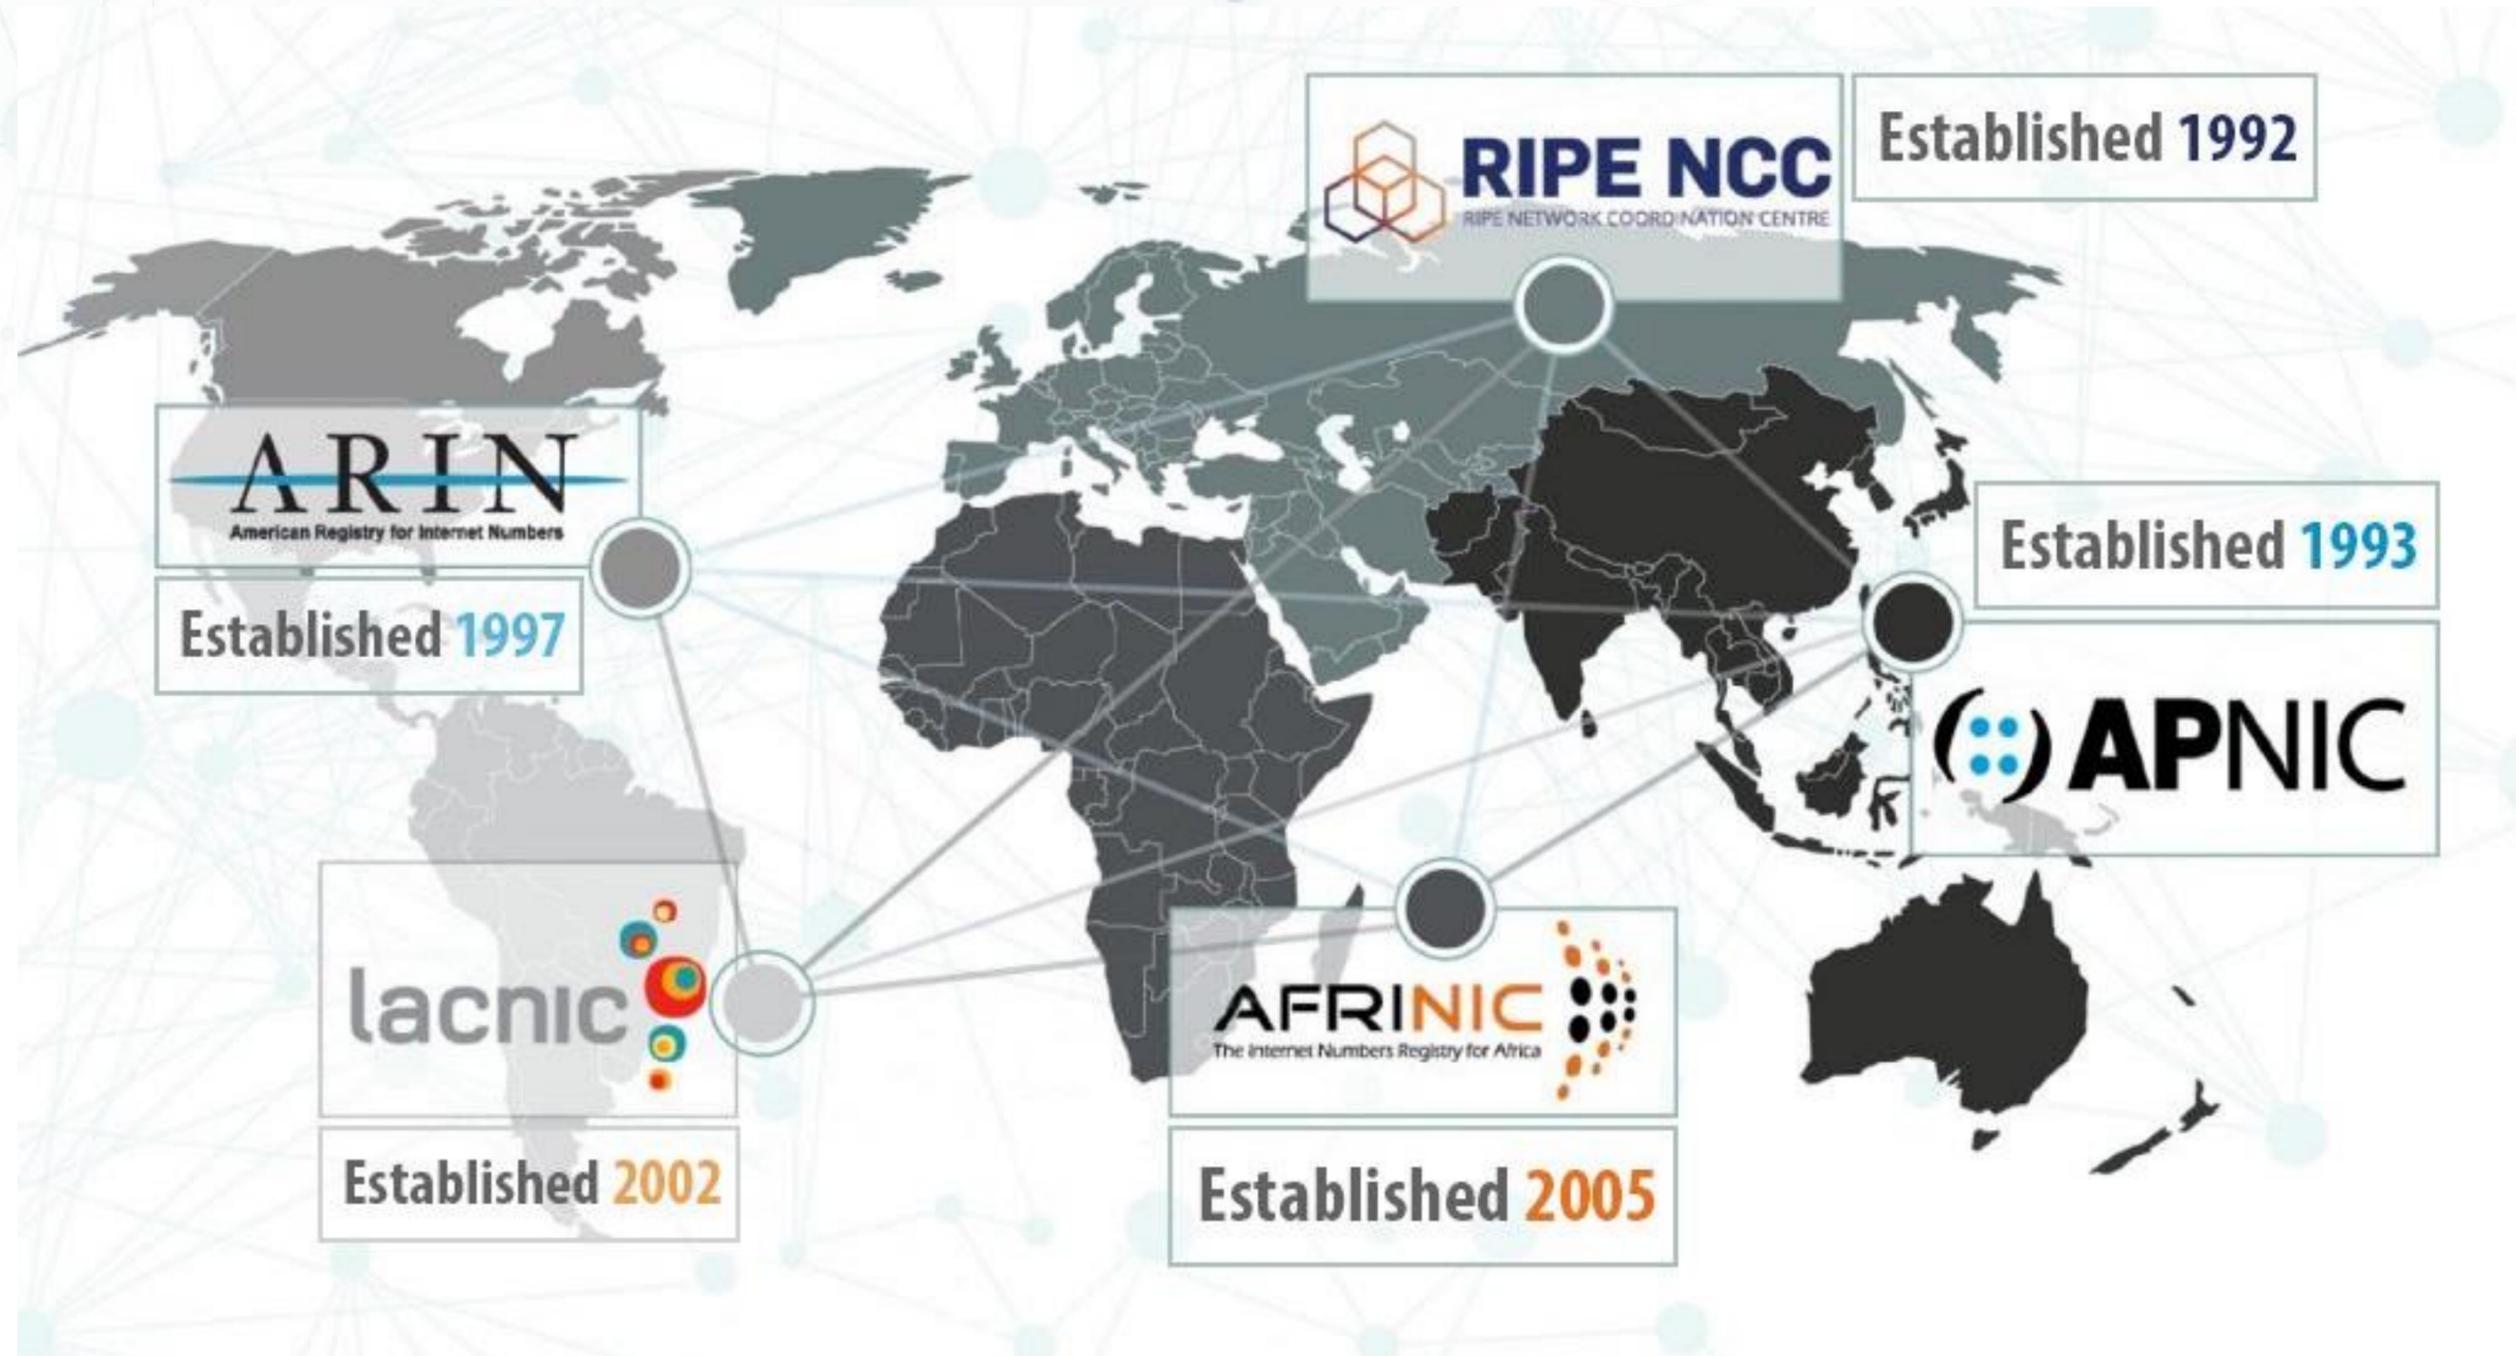

# ICANN | ASO

Address Supporting Organization

## RIR

Manages the allocation, administration and registration of Internet number resources in a specific region of the world.

## The RIRs

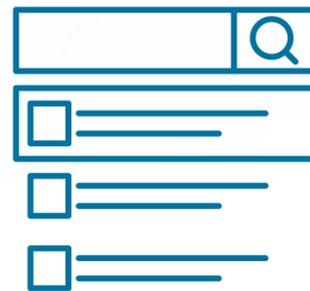

## Functions of an RIR

Manage and distribute Internet Number Resources:

Resources:

- IPv4 and IPv6 addresses
- Autonomous System numbers (ASNs)

Maintain directory services including:

Whois, Whoas, and routing registries

Provide reverse DNS

Support Internet infrastructure through:

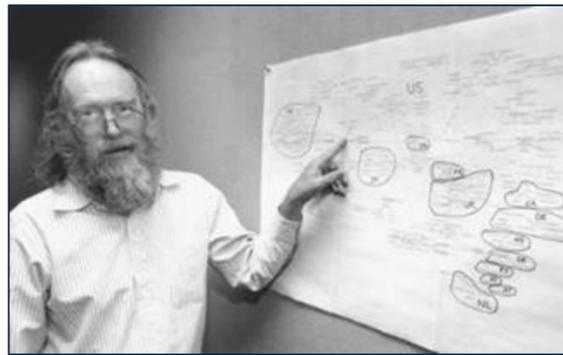

- Technical coordination
- Community-driven policy process
- Training and capacity building

# ICANN | ASO

Address Supporting Organization

## Internet Foundation

US Government  
separates commercial  
from military.

1980s-1990s

US DoD

Jon Postel

Network Solutions

Regionalization  
begins

## Early Registrations

Early IP address space referred to as “legacy space”

Internet number  
resources  
allocated liberally

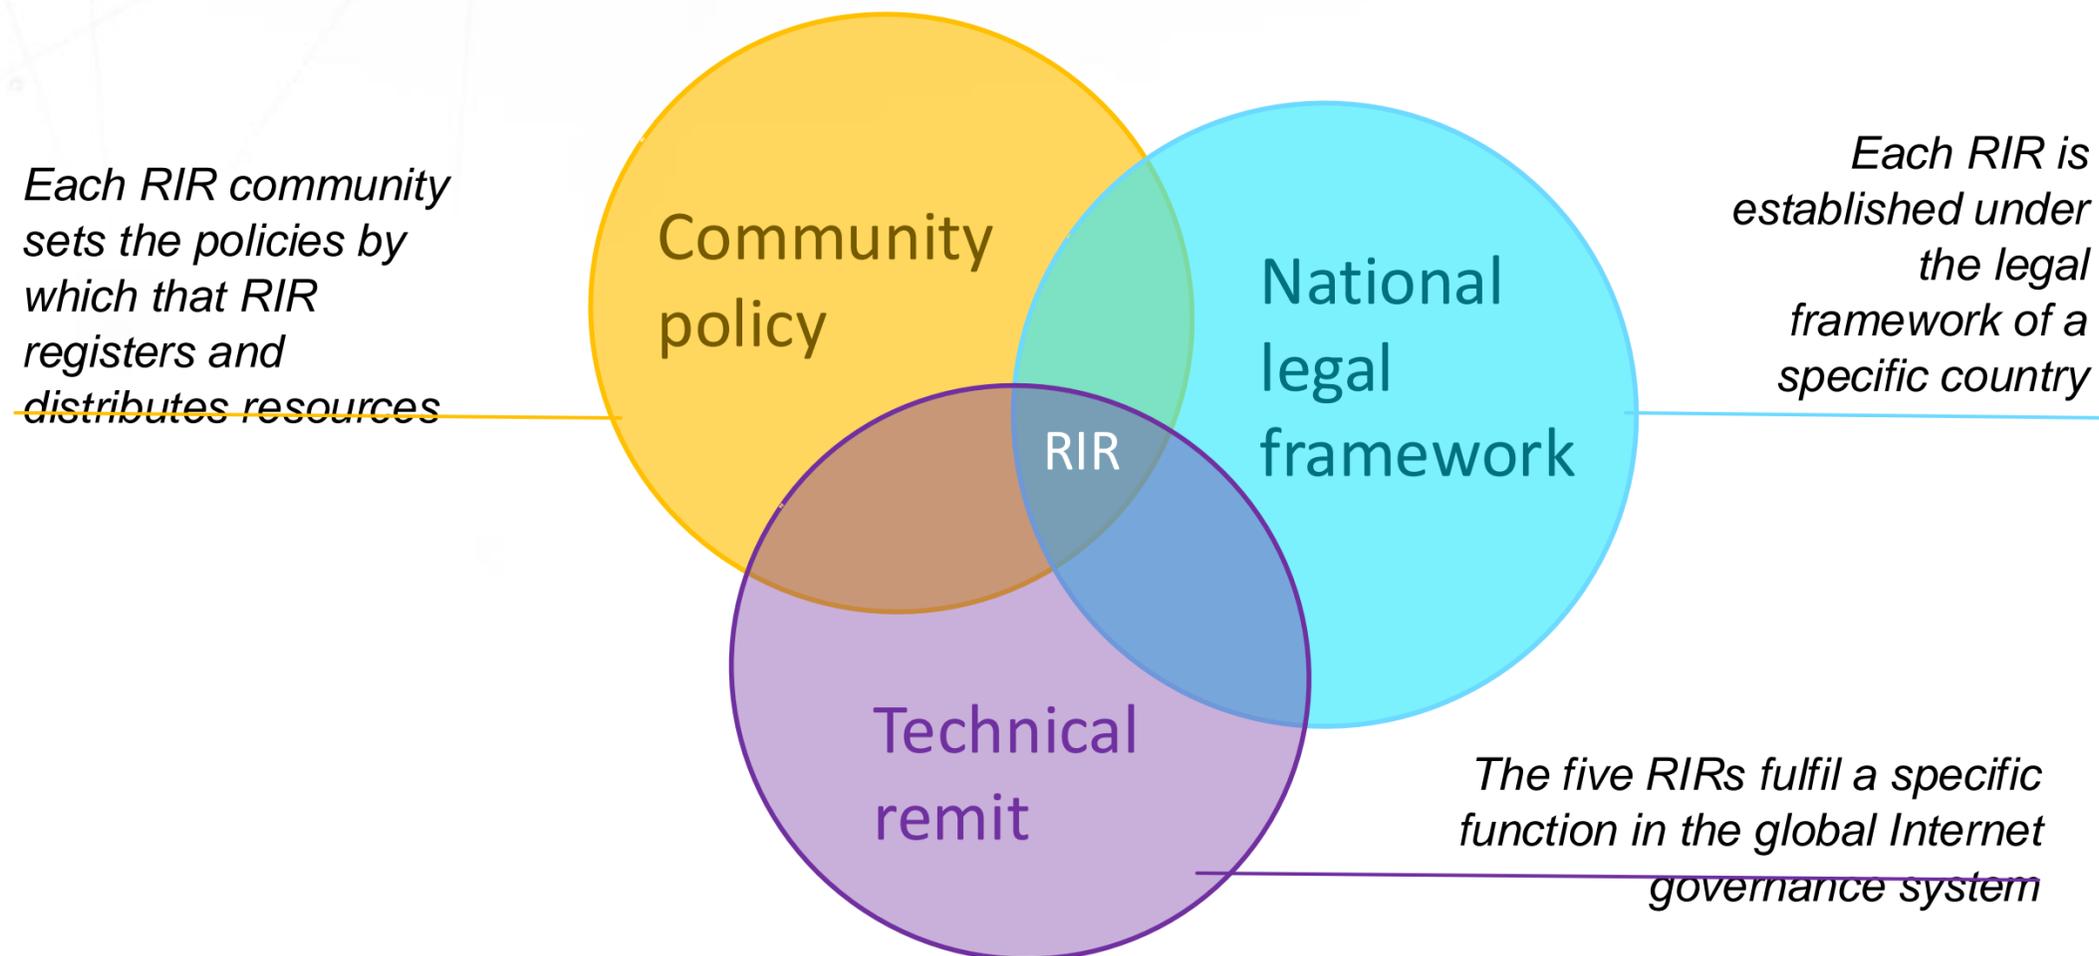

Organizations made  
simple request; no  
contract required

The Internet rapidly  
expanded,  
distribution could not  
be managed this way

## RIR Governance

Each RIR operates in accordance with three factors

# ICANN | ASO

Address Supporting Organization

## Core Functions

Non-profit, member-based organizations

Manage, distribute, and register Internet Number Resources  
Maintain directory services

Support Internet infrastructure through technical coordination

Facilitate community-driven policy development

# Important Key Elements of an RIR

Independent

Nonprofit

Membership  
based

Community  
Regulated

## Policy Development Multistakeholder approach

## RIR Policy Development Process

### Inclusive

Anyone can participate

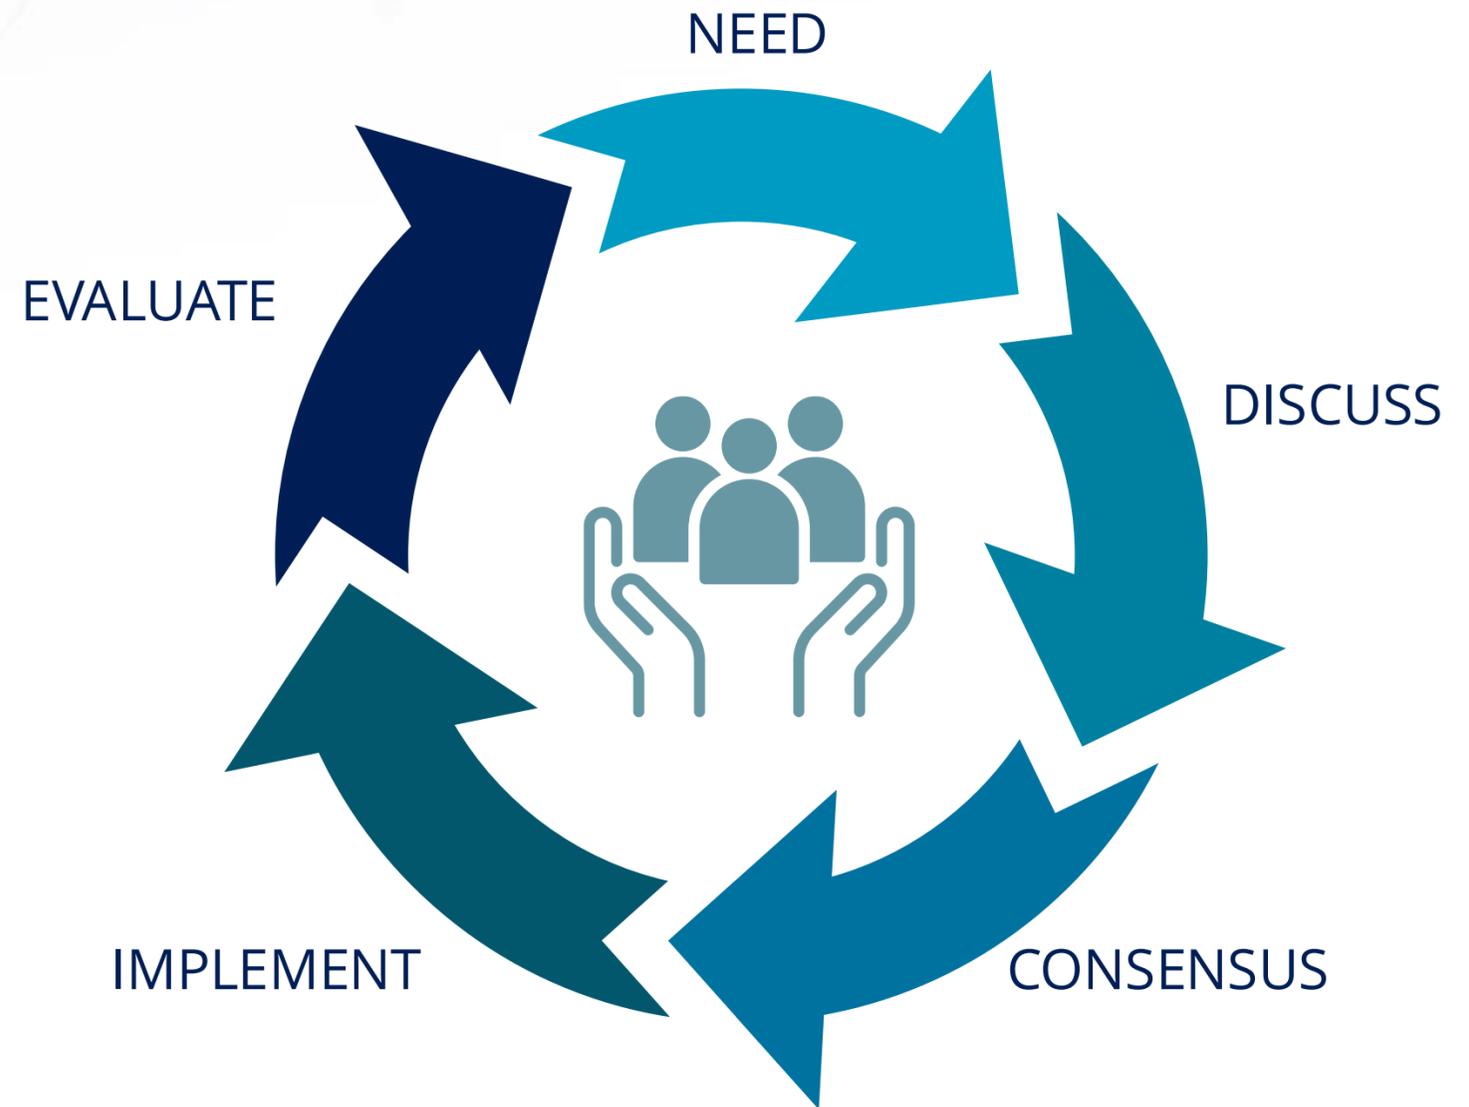

### Bottom Up

Internet community proposes and approves policies

### Transparent

Documented and published decisions and policies

## Number Resource Organization (NRO)

[www.nro.net](http://www.nro.net)

To actively contribute to an **open, stable, and secure Internet** by:

- Providing and promoting a coordinated Internet number registry system
- Being an authoritative voice on the multistakeholder model and bottom-up policy process in Internet governance
- Coordinating and supporting joint activities of the RIRs

## NRO Publications

- **Global Internet Number Statistics**
  - Internet Number Resources Status Report (updated quarterly)
  - Global stats on IPv4, IPv6, ASN (updated daily)
  - RPKI Adoption Reports by IPv4, IPv6, economy (updated daily)
  - <https://www.nro.net/statistics>
- **Comparative Policy Overview**
  - Updated quarterly
  - Information on RIRs Membership policies (access to delegation and registration services)
  - <https://www.nro.net/rir-comparative-policy-overview>

## ICANN Policy Development Stakeholders

### Supporting Organisations

ASO: Address Supporting Org.  
GNSO: Generic Names Supporting Org.  
CCNSO: Country Code Names Support Org.

### Advisory Committees

At Large Advisory Committee  
DNS Root Server System Advisory Committee  
Governmental Advisory Committee  
Security and Stability Advisory Committee

### Technical Liaison Group

Works with the organisations developing the basic Internet protocols.

### ICANN policy development stakeholders

#### Supporting organisations

#### Advisory committees

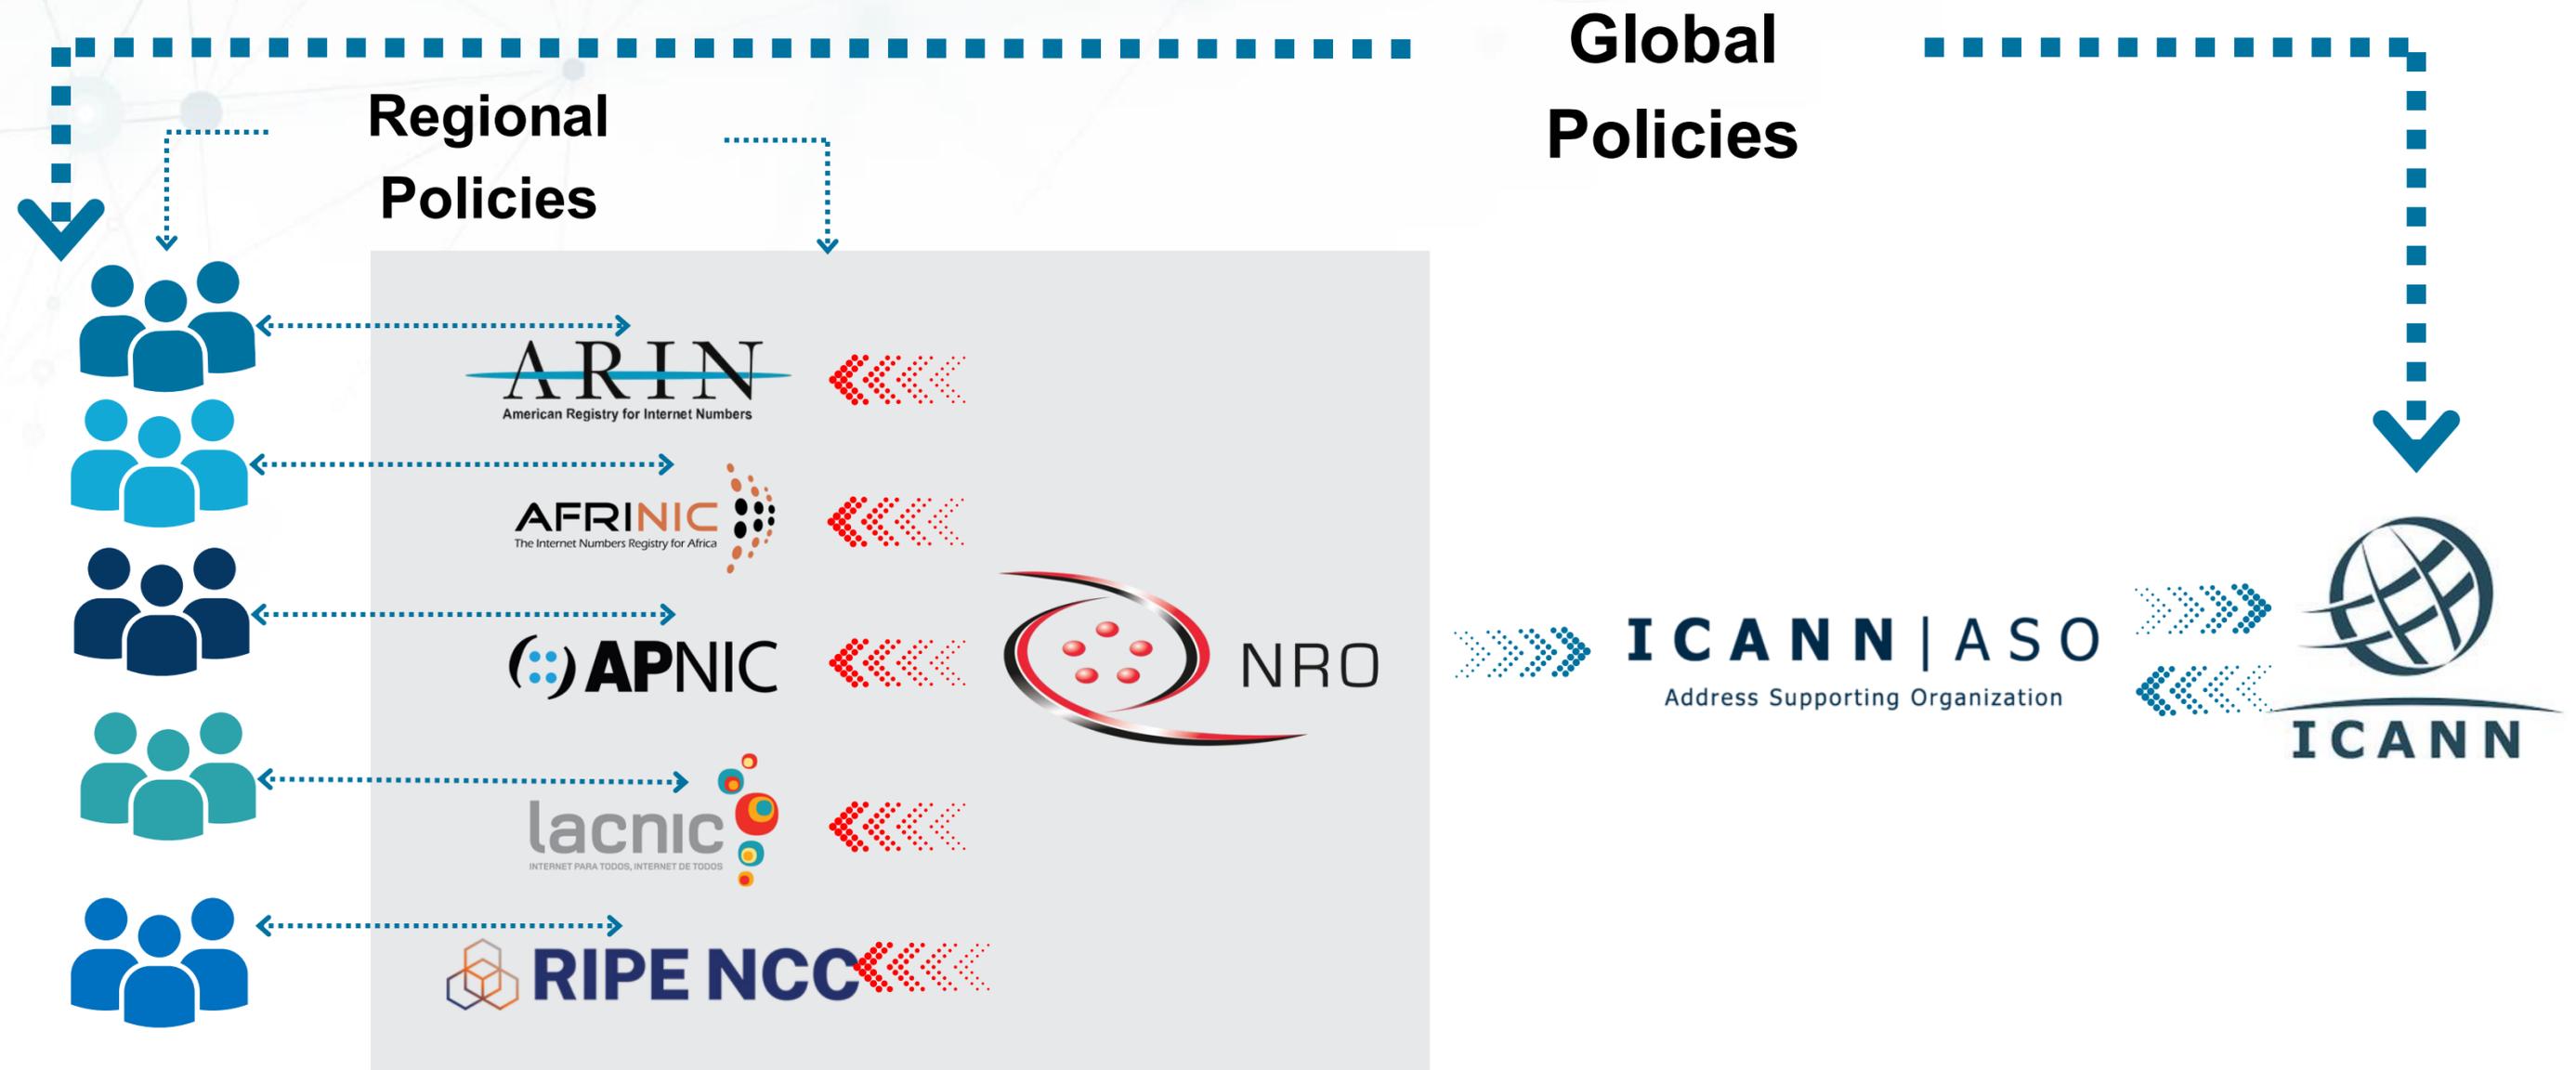

#### Technical liaison group

## ICANN ASO AC (Address Council)

<b>Who is it:</b>	<b>NRO Number Council</b>
<b>What is it?</b>	Number Resource Advisory Council
<b>How is it Organized?</b>	15 Members [3 From Each Region] – 2 Elected at Large – 1 Appointed by RIR Board • RIR & ICANN Observers
<b>Term of Office</b>	Different for every RIR
<b>What Does it Do?</b>	Advise ICANN Board on Internet Numbers • Overseeing the Global Policy Development Process • Appoint ICANN Board Members (2) • Appoint member to ICANN NomCom (1)

# Global Policy Development Process

Policy Making  
Communities

Facilitators

**ICANN | ASO**

Address Supporting Organization

# Internet Number Resources

**IPv4, IPv6, Autonomous System Numbers (ASNs)**

# ICANN | ASO

Address Supporting Organization

## IPv4

32-bit addresses;

Written in dotted decimal

$2^{32}$

Example:

205.150.58.732

## IPv6

128-bit addresses;

Written in hexadecimal

$2^{128}$

Example:

2001:0503:0C27:0000:0000:0000:0000

# IP Addresses

## Autonomous System Numbers (ASNs)

Globally unique numbers used to exchange routing information with neighboring autonomous systems

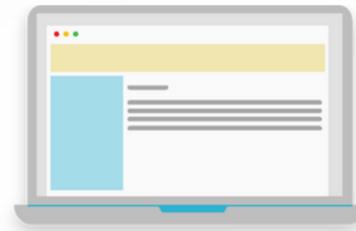

Group of IP networks administered under the umbrella of a single entity

Network operators must have an ASN to control routing within their network and to exchange routing information with other Internet Service Providers

## IP Addresses are *Not* Domain Names

### IP address

[Identifier]

e.g. 2001:0db8:85a3:0000:0000:8a2e:0370:7334

- Computers recognize **numbers**
- Identifies a device on the Internet
- Used for routing (moves information across an inter-network from a source to a destination)
- Every device directly connected to the Internet requires a unique IP address

### DNS name

[Reference]

e.g. www.nro.net

- People recognize **names**
- Maps host name to unique IP address
- A means of storing and retrieving information about hostnames and IP addresses in a distributed database

# ICANN | ASO

Address Supporting Organization

## How IP Addresses are Issued

### ICANN/IANA

(Internet Assigned Numbers Authority)

Manage GLOBAL unallocated IP address pool

Allocate

### RIRs

(AFRINIC, APNIC, ARIN, LACNIC, RIPE NCC)

Manage REGIONAL unallocated IP address pool

Allocate

### ISP

(Customers)

Allocate

### End User

(Customers)

Reassign

### ISP

### End User

A background network diagram with nodes and connecting lines, some nodes highlighted with larger circles.

**ICANN | ASO**

Address Supporting Organization

# Routing

## Core Internet Functions: DNS & Routing

The Internet relies on two critical systems:

- **Routing** – forwards IP data packets between or across multiple networks from source to destination
- **DNS** - translates domain names to IP addresses (forward lookup) and IP addresses to domain names (reverse lookup)

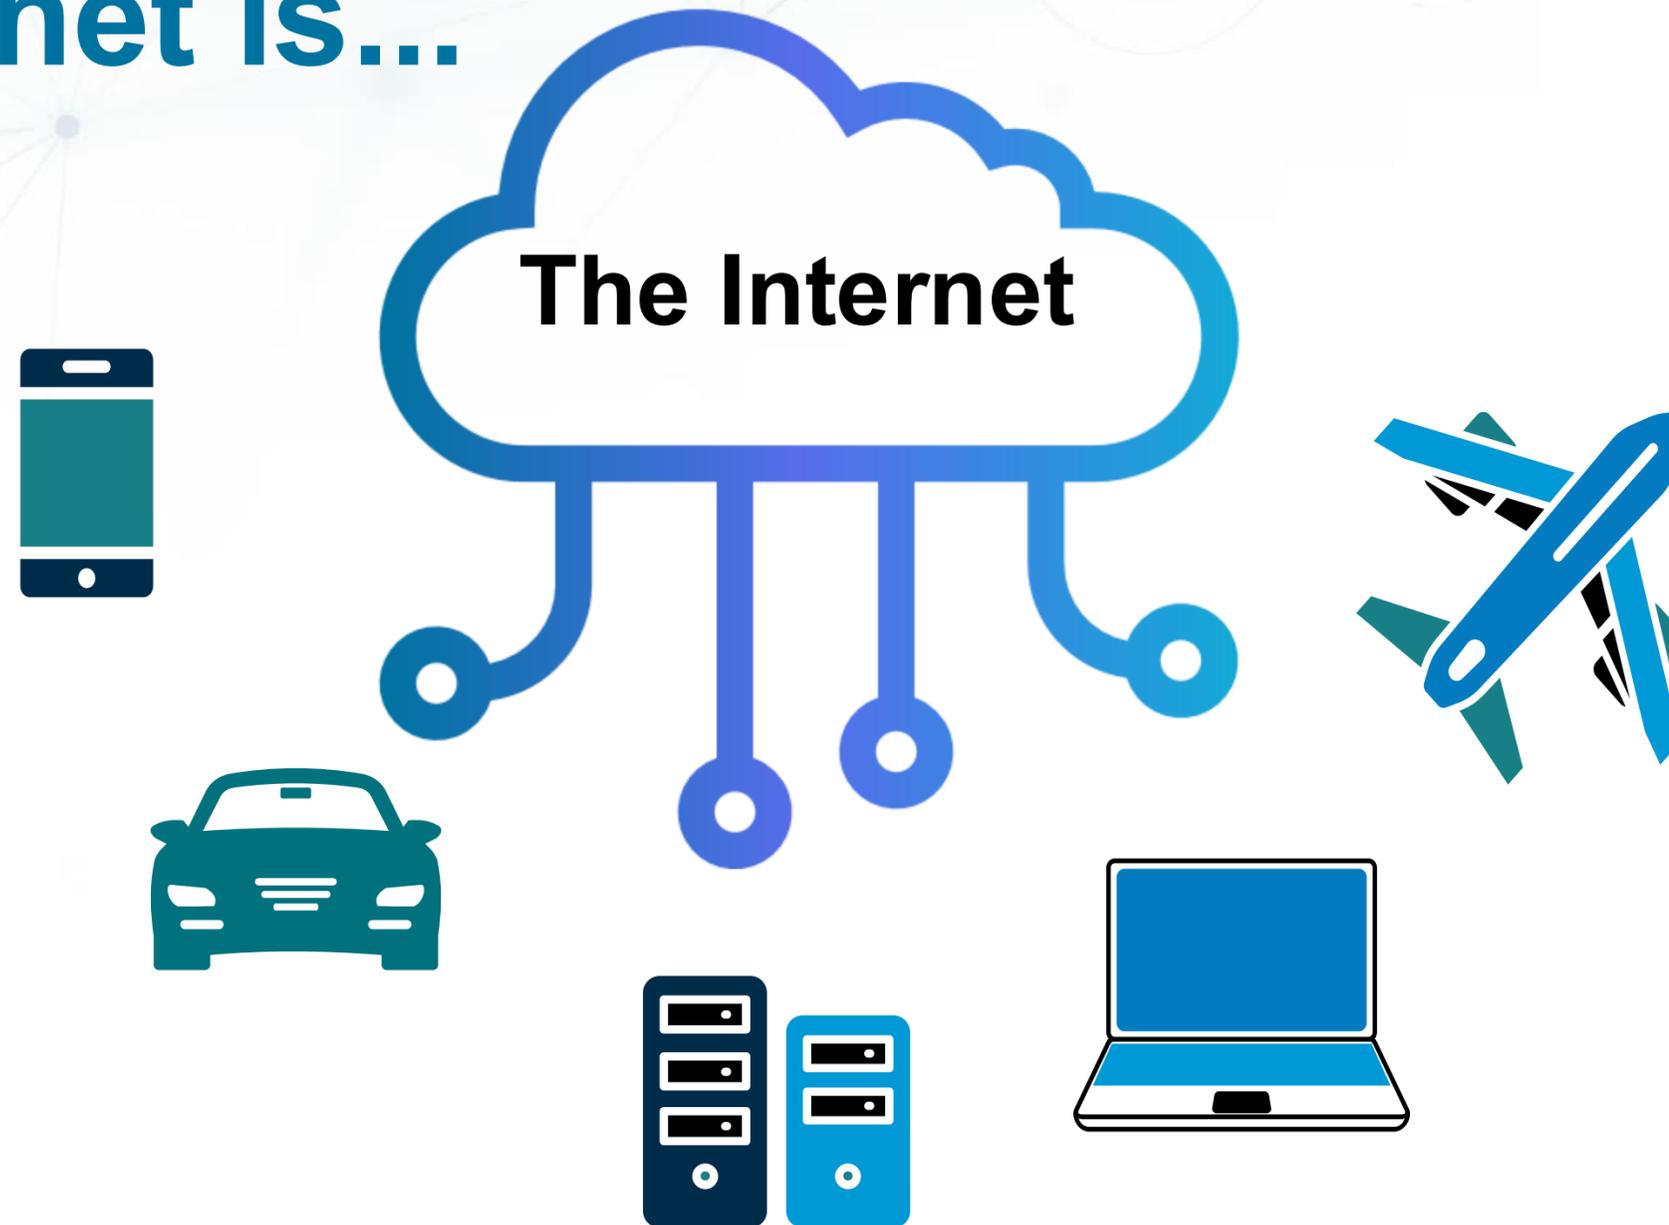

These critical systems are not secure

- Subject to misconfigurations and nefarious activity

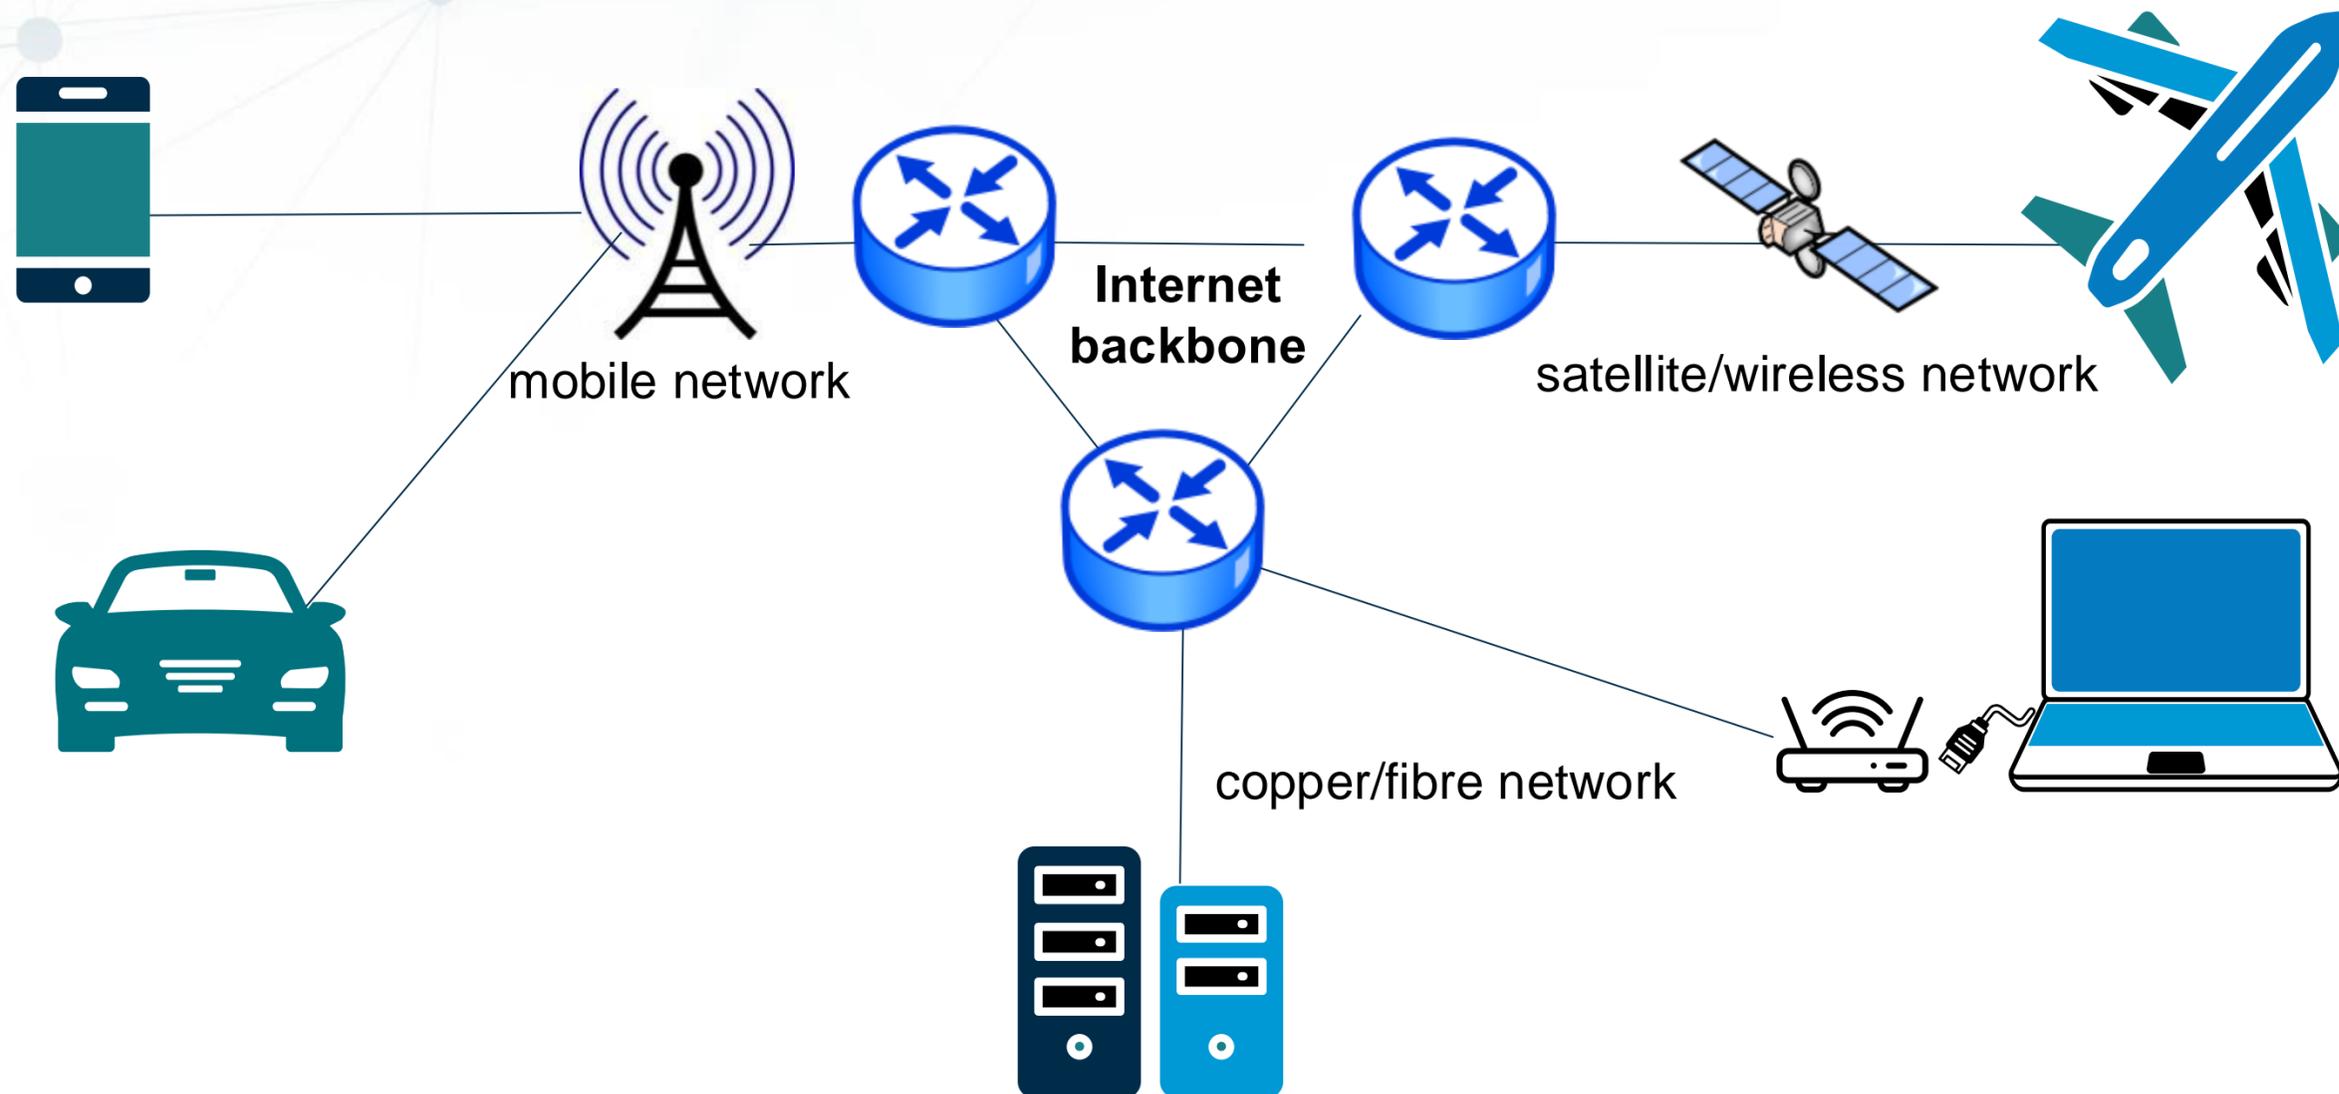

Traditional options for verifying routing

- Internet Routing Registry (IRR)
- Letters of Authority (LOAs)
- Seems "legit" (informal arrangement between ISPs)

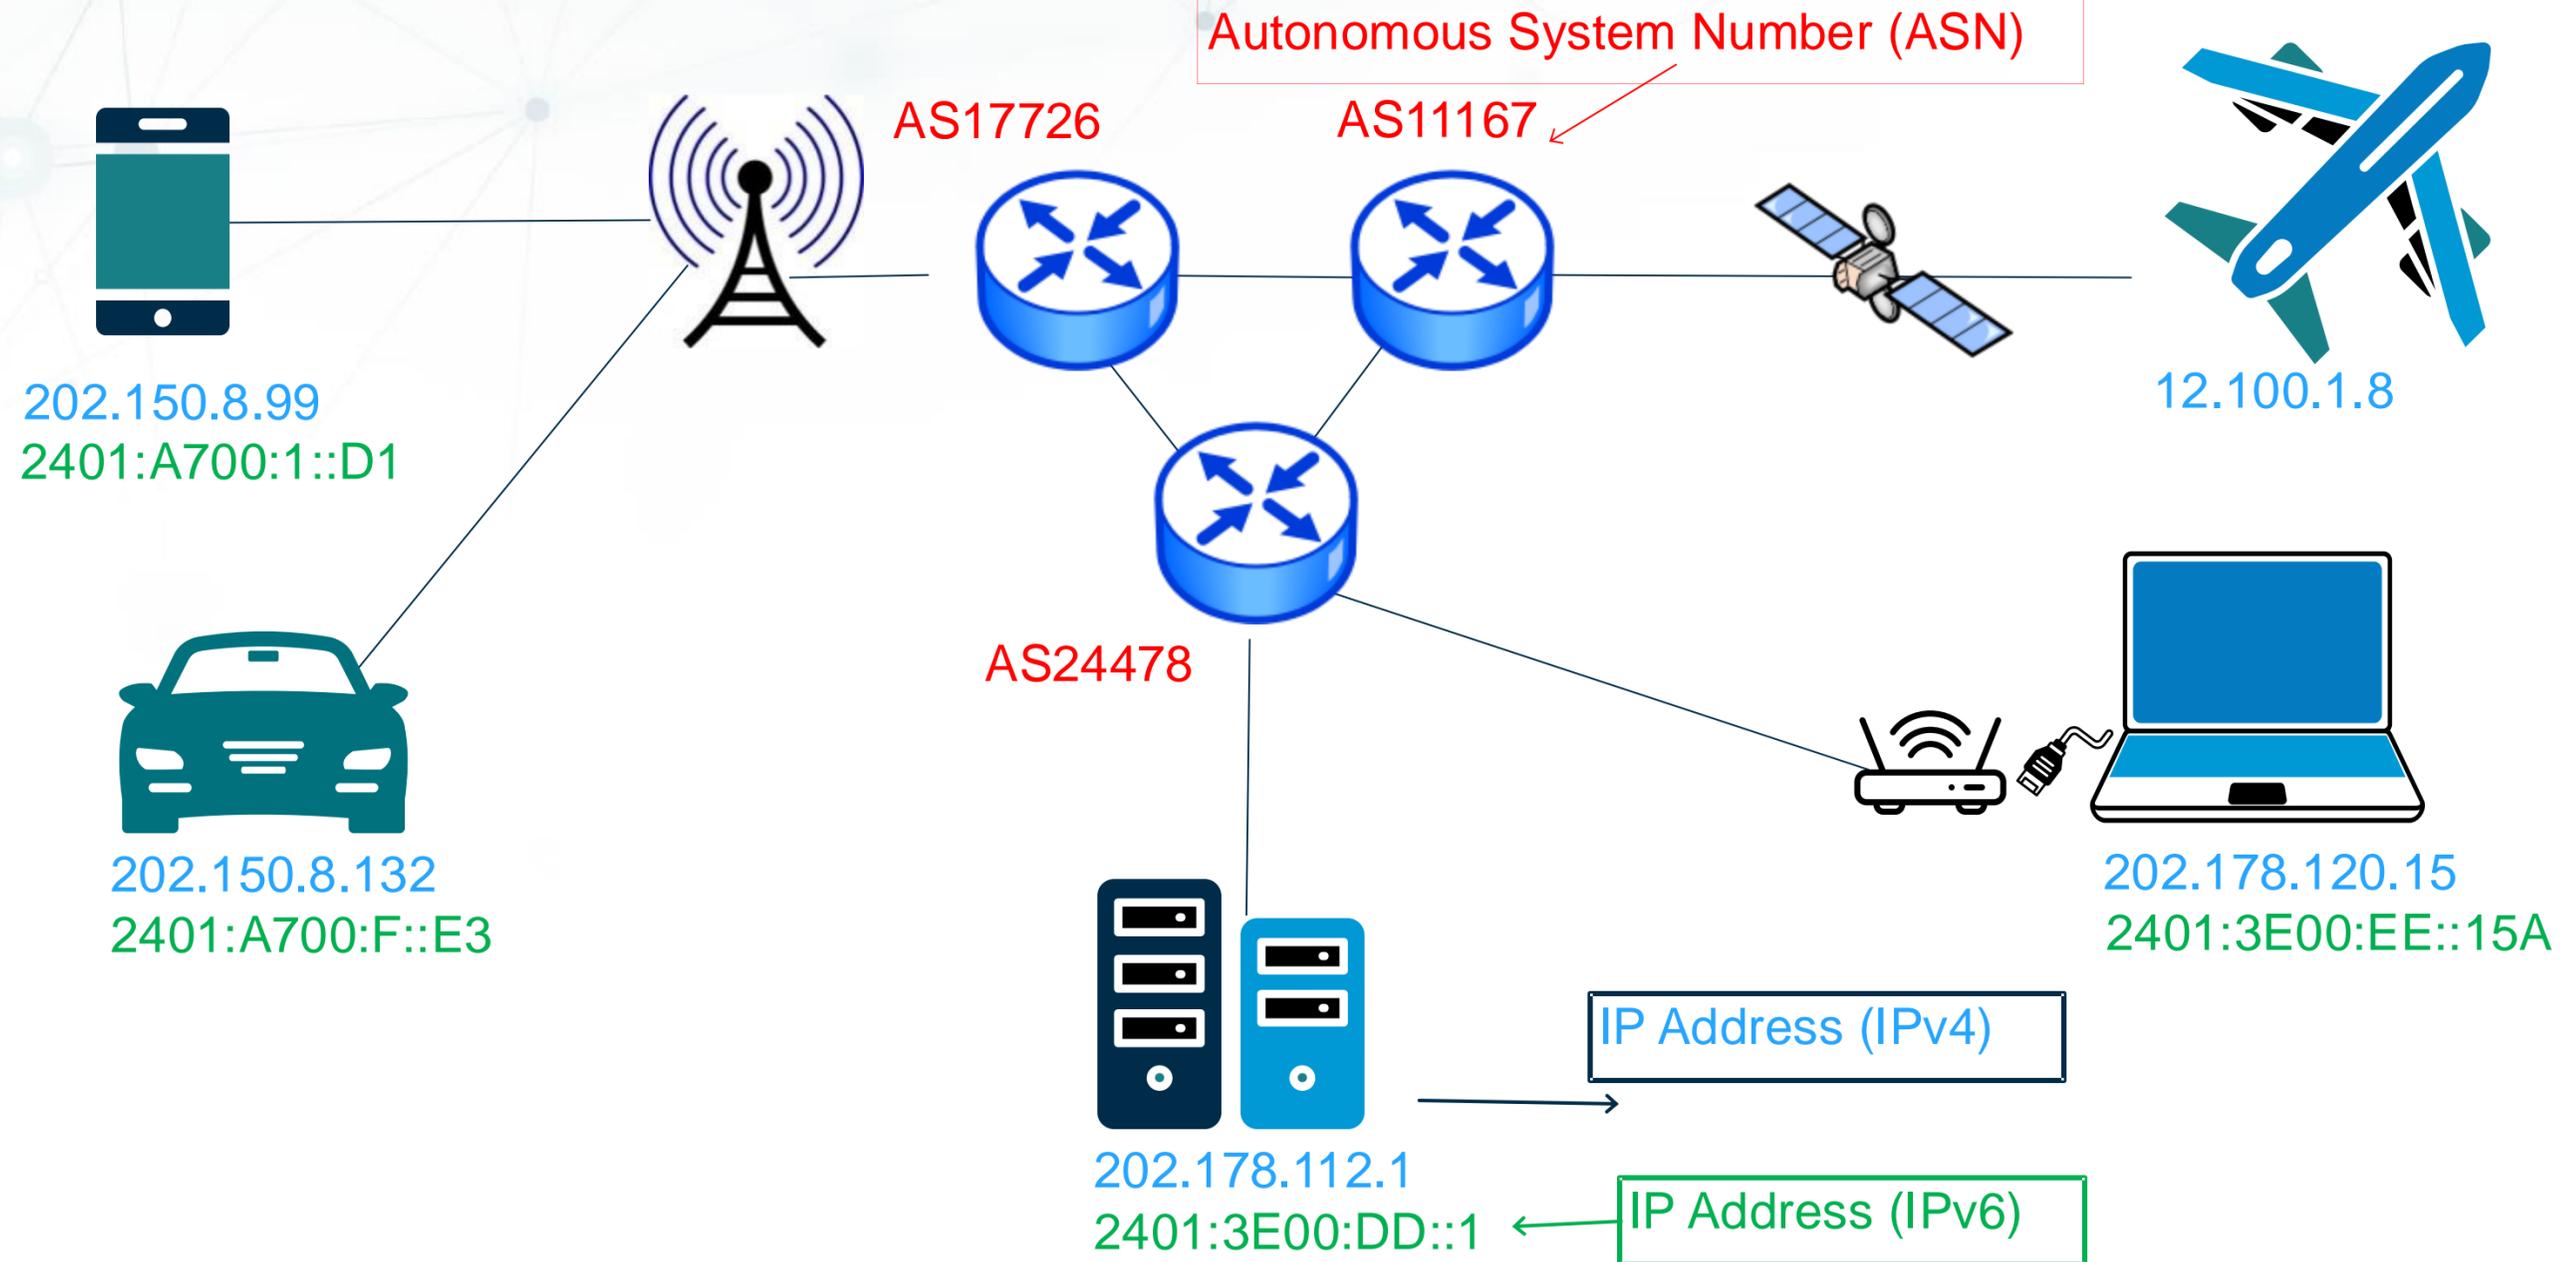

## The Internet is...

## A Network of Networks

## Networks That Use Standard Protocols

A background network diagram with light blue lines and nodes of varying sizes and colors (blue, green, grey).

**ICANN | ASO**

Address Supporting Organization

# Noteworthy Developments

# ICANN | ASO

Address Supporting Organization

## Global IPv4 Depletion at IANA – Feb 2011

Each RIR received its last /8 IPv4 address block from IANA on 3 February 2011

# ICANN | ASO

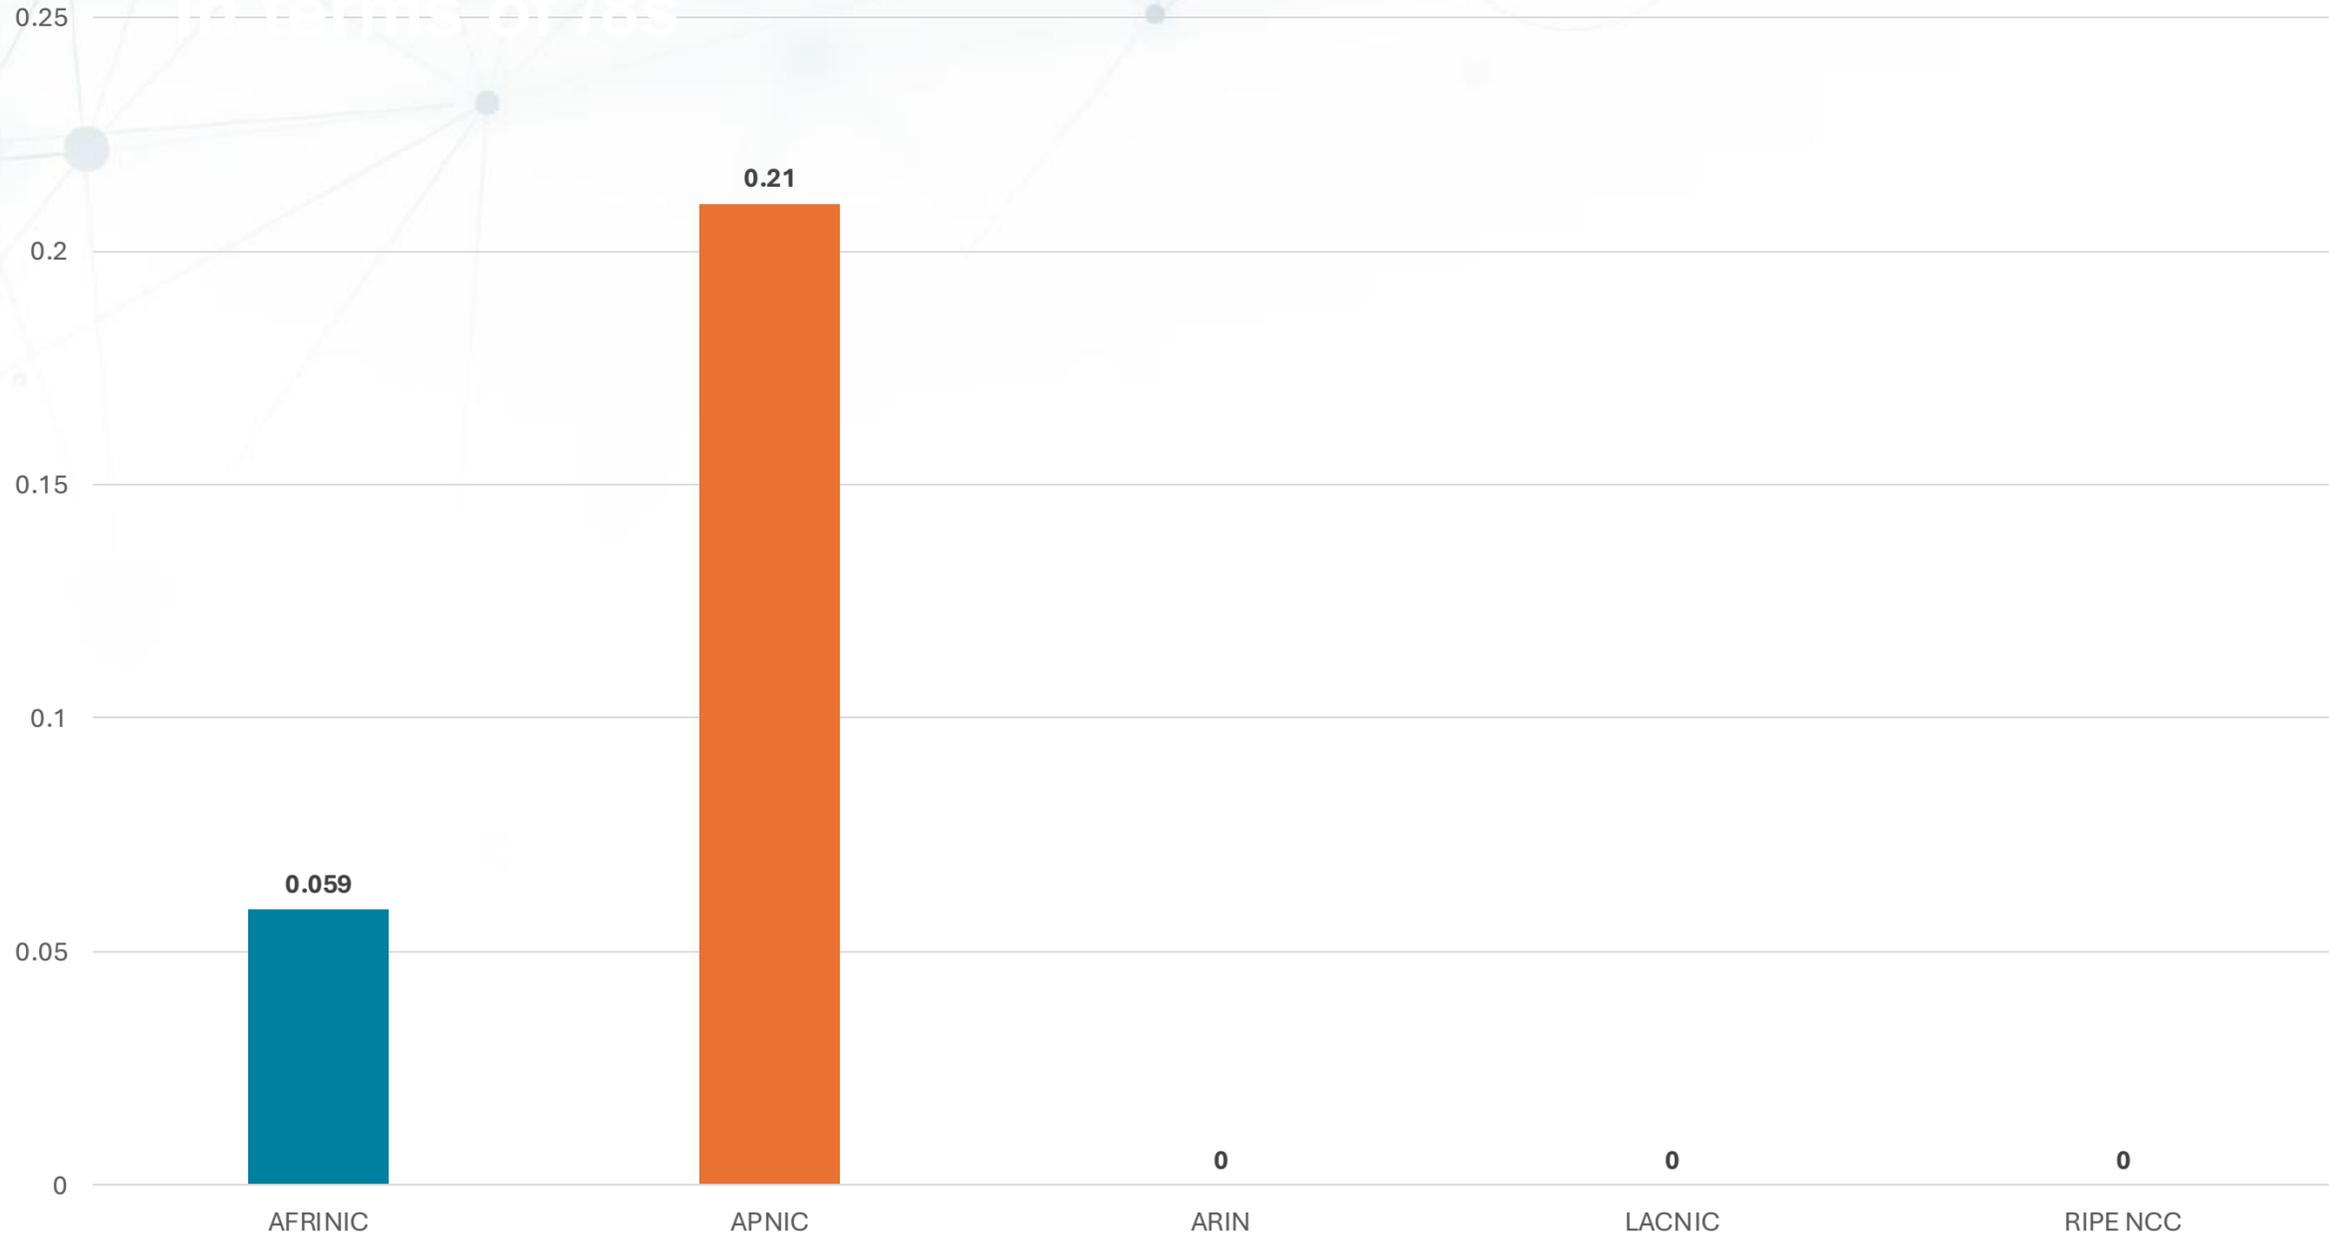

Address Supporting Organization

## Available IPv4 Space in each RIR

In terms of /8s

Measured  
in /8s

As of Q4 2024

## Post IPv4 Depletion

- **Movement to IPv6 has been steady**
  - ISPs rolling out IPv6
  - Steady increase in IPv6 traffic
  - Increase in IPv6 requests
- **Still high demand for IPv4**
  - All RIRs still receiving significant number of IPv4 requests
  - Customers increasingly turning to the IPv4 market for address space
  - Increase in fraudulent requests for IPv4 space
    - Submitting falsified business records, personal ID documents, etc.

## IPv6 Deployment

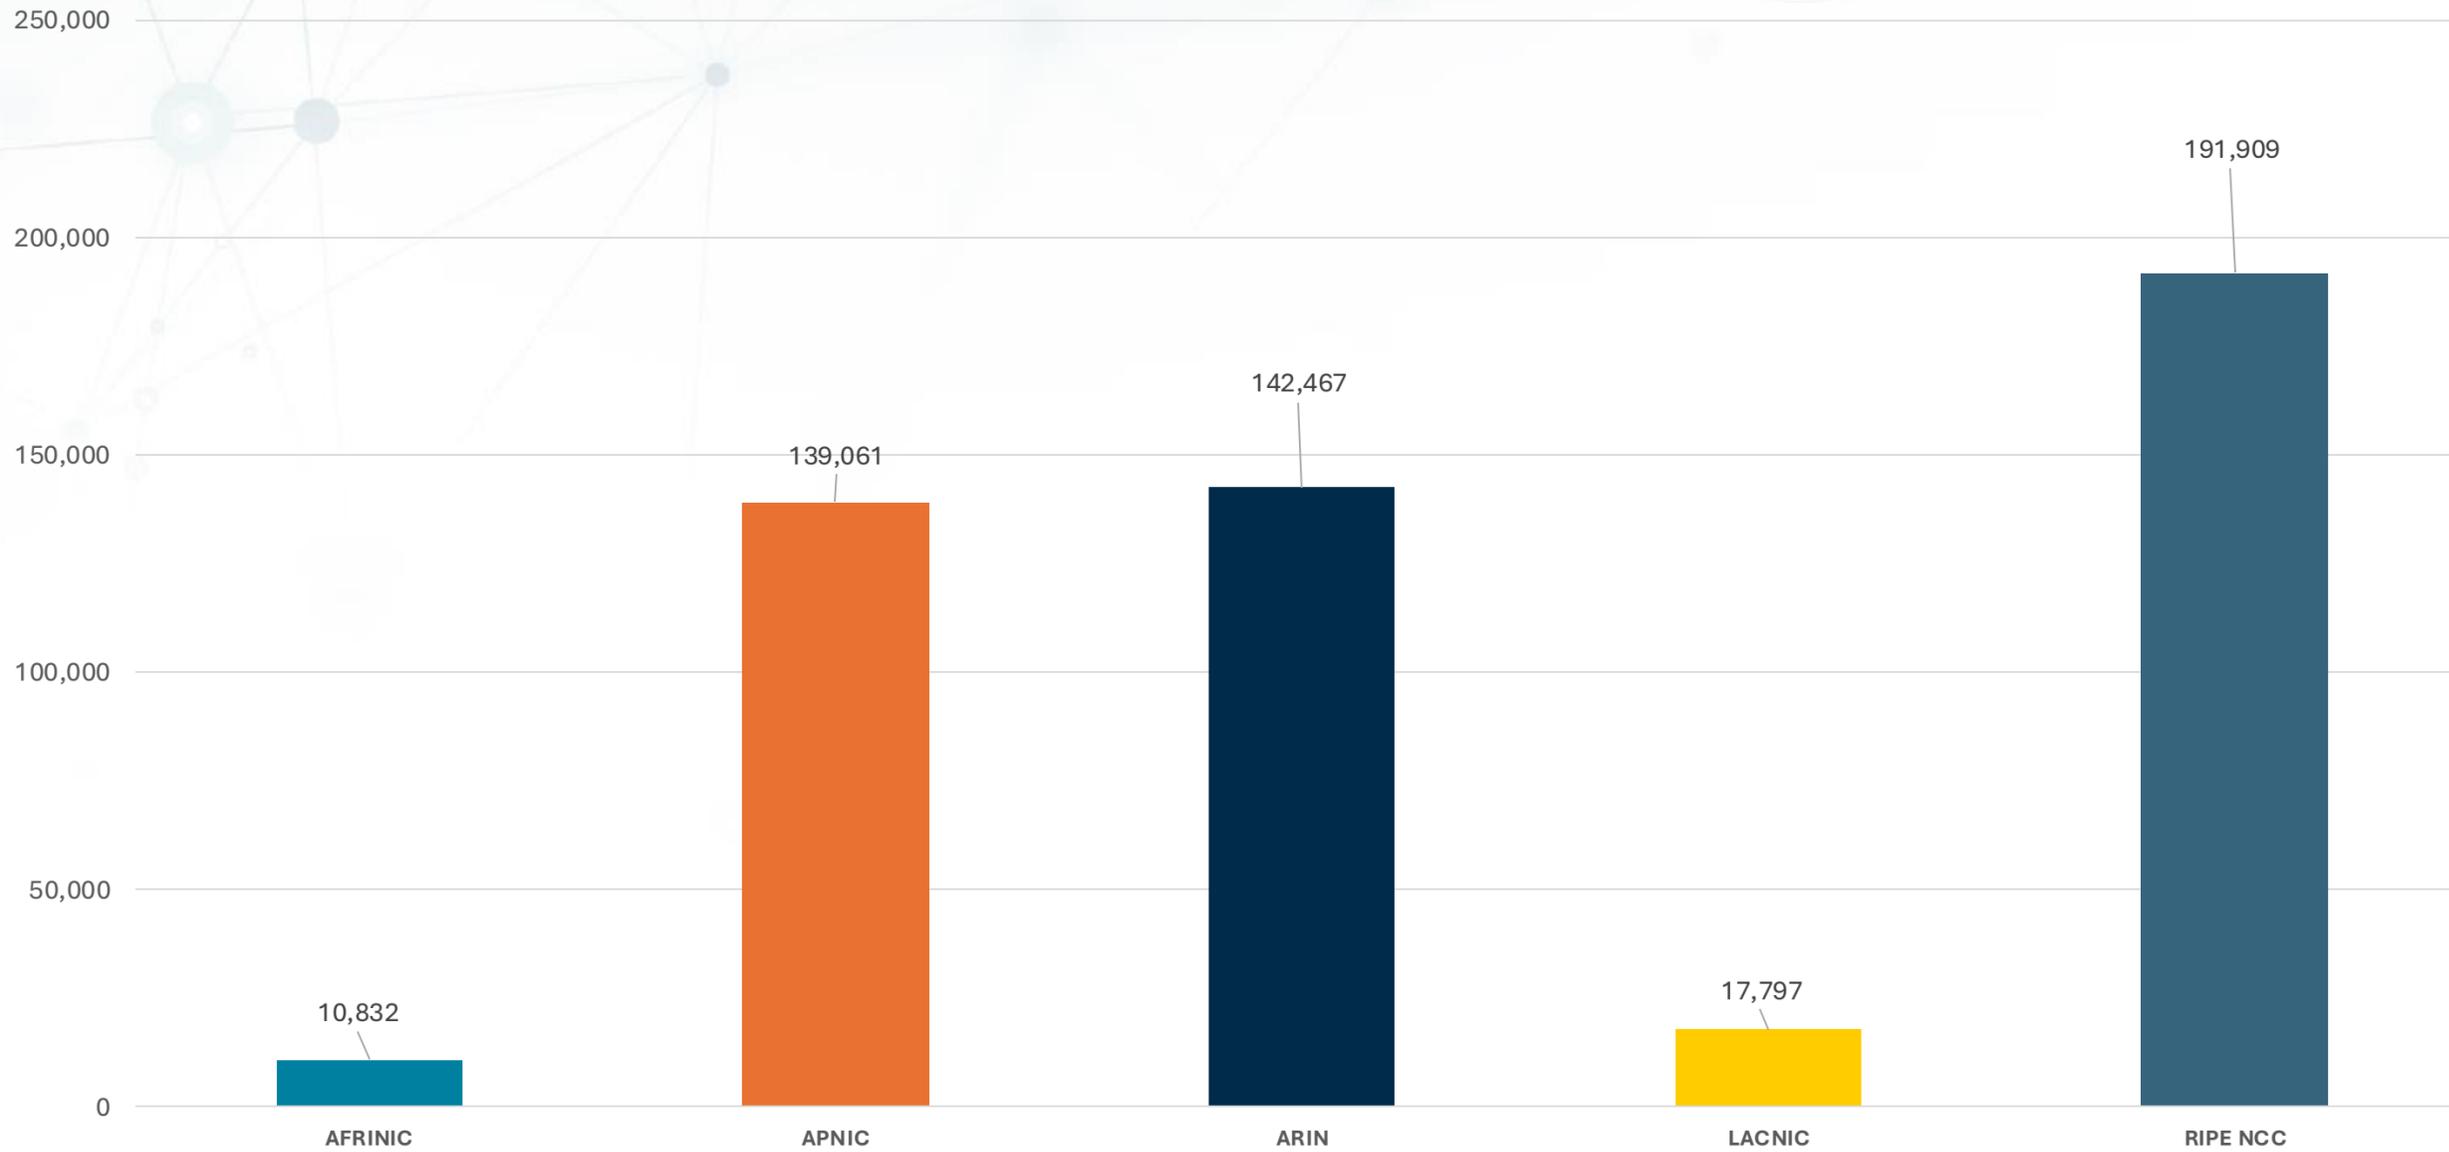

- Per ISOC the rate of IPv6 deployment is at 41% Worldwide
  - Source <https://pulse.internetsociety.org/en/technologies/>
- Google IPv6 statistics show ~44% of global Internet traffic is over IPv6
  - Source <https://www.google.com/intl/en/ipv6/statistics.html>

# ICANN | ASO

Address Supporting Organization

## Total IPv6 space (in /32s) each RIR has allocated

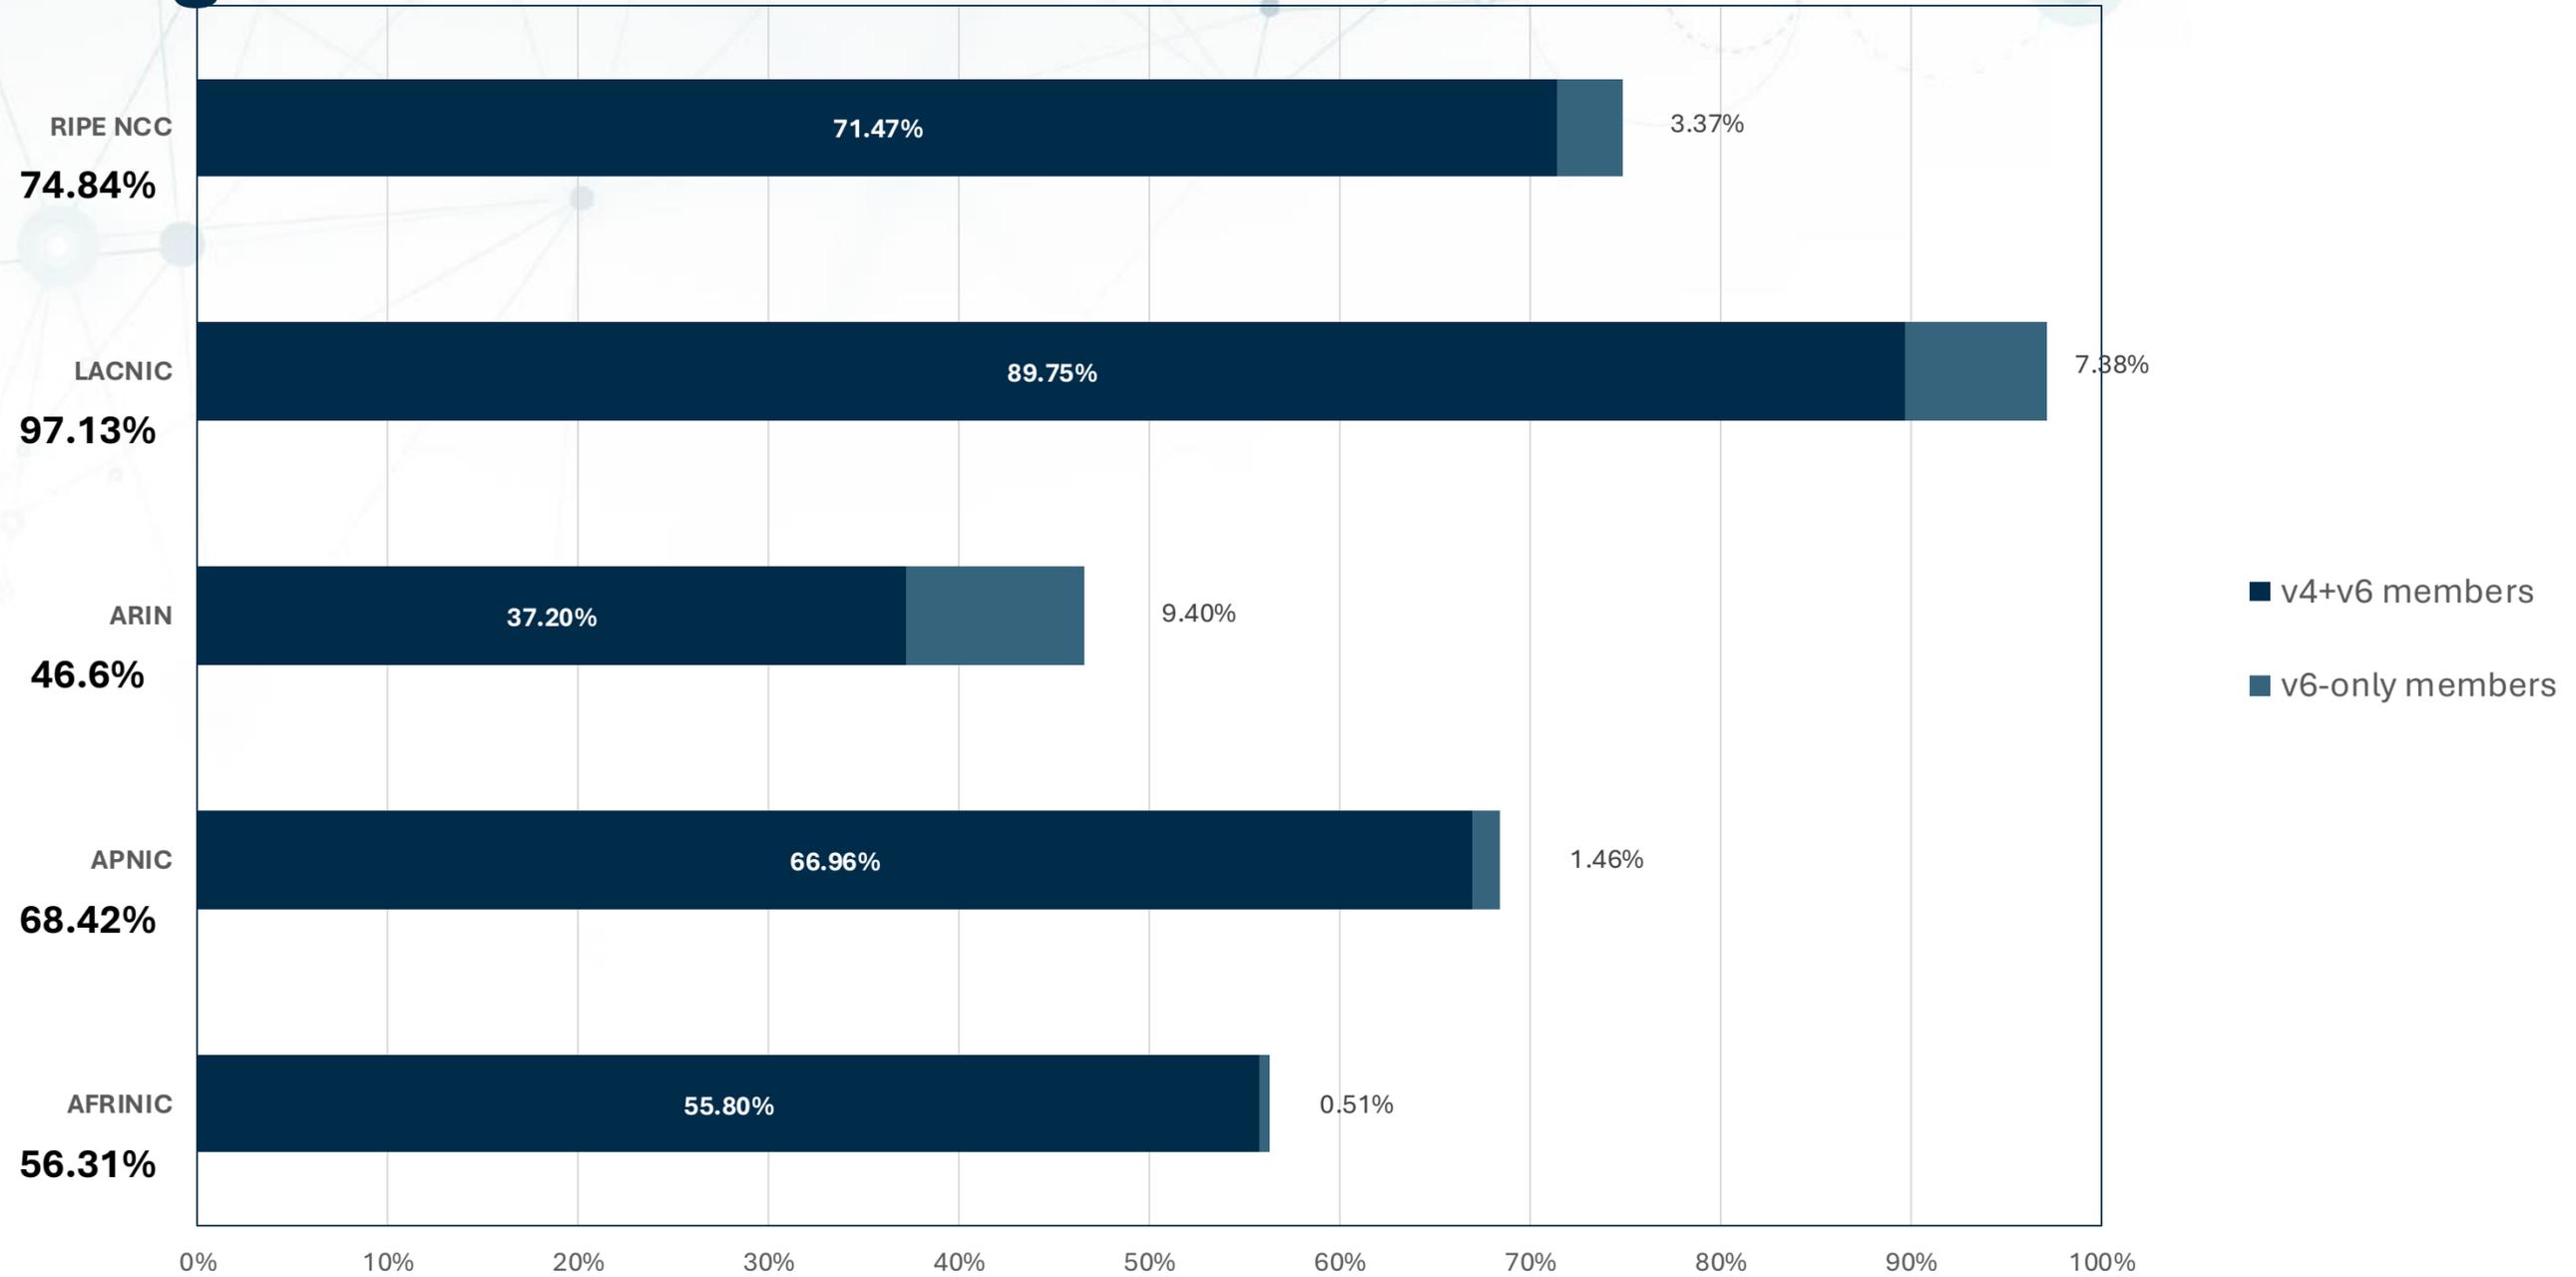

As of Q4 2024

# ICANN | ASO

Address Supporting Organization

## Percentage of Members with IPv6 in each RIR

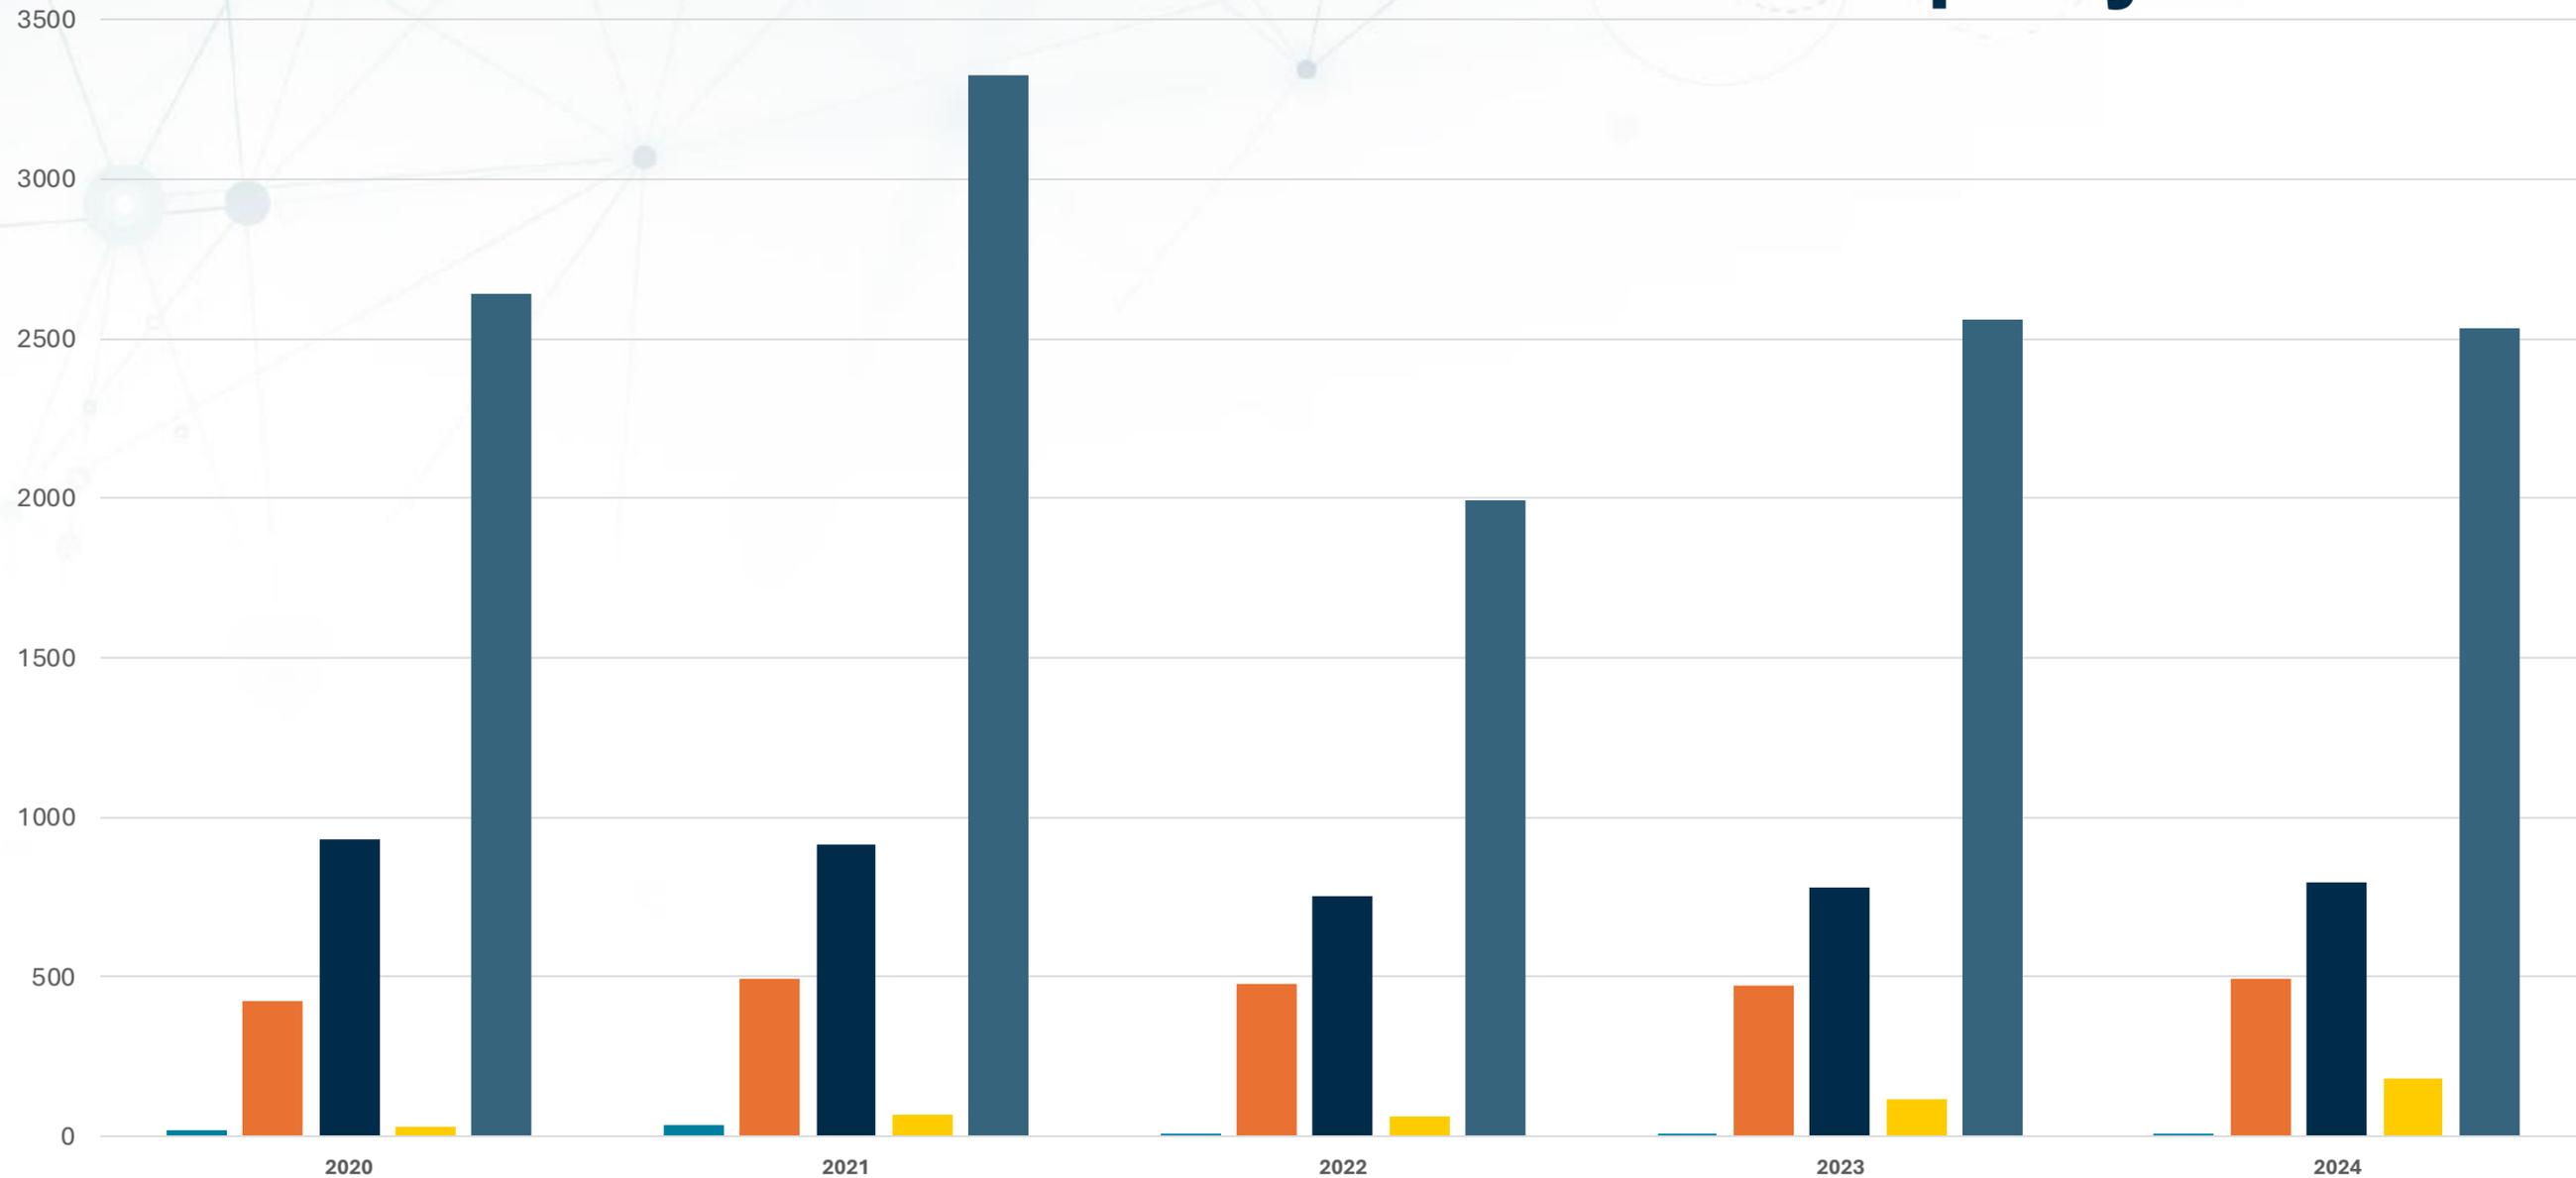

As of Q4 2024

## IPv4 Transfer Market

- Developed due to on-going demand for rapidly depleting IPv4 addresses
  - Choices were:
    - Acknowledge IPv4 market transfers through regional policies
    - Watch a black market emerge with no registry interaction
- IPv4 market transfer policies developed by communities
  - Allowed IPv4 holders to transfer space to qualified recipients
- RIR's role
  - Ensure compliance with policies
  - Maintain the accuracy of the registry
    - RIRs not privy to any financial transaction information between parties

## Intra-RIR IPv4 Transfers Number of transfers per year

As of Q4 2024

■ AFRINIC   ■ APNIC   ■ ARIN   ■ LACNIC   ■ RIPE NCC

## Inter-RIR IPv4 Transfers

Number of transfers

Number addresses transferred

	AFRINIC	APNIC	ARIN	LACNIC	RIPE NCC
AFRINIC		0	0	0	0
APNIC	0		216 1.744M	18 .02178M	535 3.695M
ARIN	0	489 19.863M		29 .03034M	670 27.312M
LACNIC	0	5 .0076M	24 .0693M		35 .0648M
RIPE NCC	0	152 2.5942M	298 8.245M	15 .01356M	

A background network diagram with nodes and connecting lines in shades of blue and grey.

**ICANN | ASO**

Address Supporting Organization

# RIR Services and Tools

## Public directory service

- Used to query databases that store registered users of an Internet resource

## Whois

Differs in usage/content depending on the type of registry

- Number resource registries
- Domain name registries and registrars
- Routing registries

RIR's Whois registry is still publicly accessible

## RIR Whois Information

- **Publicly displayed** registration data including:
  - IP number resources issued by RIRs or predecessor registry (“**legacy**” space)
  - Organizations and their contact info (mailing addresses, emails, phone numbers)
  - Original registration date and last updated date
  - Customer reassignment information (ISP → customers)
  - Referential information to authoritative RIR

## Future of Whois

### Registration Data Access Protocol (RDAP)

- **RDAP** - new protocol for accessing registration data in a machine-readable way
  - Standardization (command, output & error structure)
  - Redirection capabilities (to authoritative server)
  - Support for user identification, authentication and access control
  - Supports Internationalization
- ICANN requires accredited registrars and gTLD registries to implement RDAP (in addition to port 43 WHOIS and web-based WHOIS)
- All RIRs and some DNRs have set up RDAP clients

## Routing Security Tools

The RIRs have deployed two technologies to help secure Internet routing:

- Resource Public Key Infrastructure (**RPKI**)
  - Security framework designed to improve/secure the Internet's routing infrastructure
  - Verifies association between resource holders and their number resources
- Validated Internet Routing Registry (**IRR**)
  - Validation mechanisms added to IRR that guarantee routing announcements are published only by an authorized network

## Resource Public Key Infrastructure (RPKI)

- Public key infrastructure framework designed to secure the Internet's BGP routing infrastructure
- Cryptographically certifies network resources (AS Numbers & IP address prefixes) and route announcements
- Route Origin Authorizations (**ROAs**) define which AS is authorized to originate a prefix
- Provides stronger validation than existing technologies such as:
  - Internet Routing Registries (IRR)
  - Letters of Authority (LOA)
- All five RIRs (NRO) collaborating on this cross-RIR project

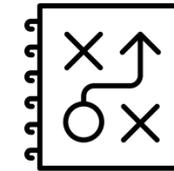

## Why is RPKI Important?

Establishes a **level of trust** that the RPKI information is authentic and is confirmed coming from the authorized holder of the resources

The RPKI gives network operators a **method to make better judgments** on which is the valid source (origin) of a route announcement

RPKI can **limit the impact** of a configuration mistake or nefarious activity of a bad actor

## RPKI RIR Adoption

**% of IP address space covered by RPKI certificates as of 1 March 2025**

REGION	IPv4 ADOPTION	IPv6 ADOPTION
AFRINIC	32.45	10.76
APNIC	36.55	18.20
ARIN	38.23	60.72
LACNIC	53.92	54.88
RIPE NCC	71.20	40.41

<https://ftp.ripe.net/pub/stats/ripenncc/nro-adoption/latest/rir-adoption.txt>

## Internet Routing Registry (IRR)

- Database of Internet route objects operated by individual organizations (e.g., the RIRs)
  - Used to determine and share routing policies and announcements between network operators
- Ensures stability and consistency of Internet-wide routing
  - Provides mechanism for validating contents of announcements
  - Widely deployed to prevent accidental or intentional routing disturbances
  - Susceptible to error or manipulation
- RIRs working individually to add better validation processes to ensure accuracy and enhance security

## NRO RPKI Program: Securing the Internet routing system, together

Purpose: “To provide a more consistent and uniformly secure, resilient and reliable RPKI service”

Why is it important?

1. It creates a space for structured **coordination and collaboration** on RPKI among the RIRs
2. Current **diversity/inconsistency** among RIRs’ RPKI implementations
3. Some RPKI challenges/concerns need to be addressed by the five RIRs **in alignment**

**ICANN | ASO**

Address Supporting Organization

# **NRO Program Objectives**

## **Progress towards improved transparency, robustness, and security of the RPKI system**

- Building on 2024 work:
  - Key aspects of robustness documented
  - TA configuration problem statement and potential solutions

## **Increased consistency of the RPKI system user experience**

- Building on 2024 work:
  - Documentation of baseline for RPKI services/features offered by each RIR
  - User research with users interacting with multiple RIRs

## **The technical community is kept informed and engaged throughout the program.**

- RPKI Program updates presented at relevant events
- Blog articles in RIR blogs
- Etc.
